☎ +1 (706) 330-7317 | ✉ carrasquilla.nicholas@gmail.com | 🔗 [linkedin.com/in/nicholascarrasquilla](https://www.linkedin.com/in/nicholascarrasquilla) | 🐙 <https://github.com/NicholasCarras>

TECHNICAL SKILLS

Languages: Java, Python, SQL, C++

Frameworks/Tools: Git/GitHub/GitLab, Spring Boot, Maven, Docker, JUnit, Node.js, Postman, MCP

Technologies: REST APIs, PostgreSQL, Linux, Distributed Systems, MSSQL, Agile Methodologies, AI Agents

Spoken Languages: Spanish (Intermediate), Japanese (Beginner)

EXPERIENCE

Tarkett - Dalton, Georgia (March 2026 - Present)

Software Engineering Intern

- Developed operator-facing user interfaces for industrial automation systems using ignition, improving usability and real-time interaction with operational data
- Integrated Python scripting into UI applications to automate workflows, process data, and enhance system functionality
- Designed, wrote, and optimized SQL queries in Microsoft SQL Server to connect backend data with operator-facing applications
- Engineered a custom enterprise platform plugin using Java, leveraging OOP principles and abstract classes to encapsulate low-level networking logic and expose robust, type-safe APIs to an embedded scripting runtime.
- Collaborated with cross-functional engineering teams to implement system enhancements and improve operational efficiency
- Applied Agile methodologies throughout the software development lifecycle, collaborating with cross-functional teams through iterative development, testing, feedback, and continuous improvement.

Lockheed Martin - Marieta, Georgia (October 2023 - January 2025)

Armed Security (Security Clearance)

- Monitored high-security environments, demonstrating strong attention to detail, situational awareness, and rapid decision-making skills.
- Collaborated with personnel across teams to support safe operations and ensure compliance with established procedures and standards.

United States Marine Corps - Oceanside, California (January 2019 - January 2023)

United States Marine Corporal (Maintenance Chief/Radar Operator) (Security Clearance)

- Managed and maintained over \$200M in mission-critical equipment, ensuring operational readiness and full accountability
- Utilized GCSS (ERP system) to track inventory, maintenance schedules, and asset lifecycle data, maintaining high data accuracy
- Oversaw inventory control and maintenance workflows, improving tracking efficiency and reliability through structured processes
- Utilized radar systems to support mission execution and ensure operational objectives were met in time-sensitive environments
- Led, trained, and mentored personnel in high-tempo environments, improving team performance, accountability, and mission execution

EDUCATION

Kennesaw State University *Expected Graduation December 2026*

- Bachelor of Science in Computer Science, concentration in Software Engineering
- Relevant Coursework: Data Structures, Algorithms Analysis, Operating Systems, Software Engineering

PROJECTS

Fault-Tolerant Distributed Monitoring System | Java 17.0.19

- Developed a distributed Java Spring Boot backend system designed to simulate mission-critical monitoring infrastructure.
- Implemented RESTful APIs for node communication, heartbeat tracking, system monitoring, and automated alert generation.
- Implemented PostgreSQL integration for persistent storage of telemetry data, system events, and alert history.
- Utilized Docker and Docker Compose to containerize backend services and create a scalable multi-service environment.
- Applied fault-tolerant architecture principles, automated testing with JUnit, and Git/GitHub version control workflows.

SaaS Real Estate Metrics & Listing Optimization Platform | Python, Node.js

- Developed a SaaS platform to track real estate listing metrics, agent performance, and property analytics through manager dashboards
- Built scalable backend services with Python and Node.js for real-time data processing and reporting
- Implemented AI-powered listing optimization features to generate enhanced property listings from agent-provided data
- Applied Agile methodologies and sprint-based development practices with a team using GitLab for version control.

SysAdmin Copilot - Autonomous Linux Server Triage Agent | Python, MCP, Linux

- Developed a custom Model Context Protocol (MCP) server enabling an LLM-powered agent to securely interact with a sandboxed Linux environment for automated system diagnostics and remediation.
- Built Python-based MCP tools to translate natural-language requests into safe, bounded Linux operations for permission auditing, log analysis, service diagnostics, and configuration troubleshooting.
- Automated server triage workflows to identify and resolve issues such as incorrect file permissions, Apache failures, and MariaDB configuration errors, then verify successful service recovery.
